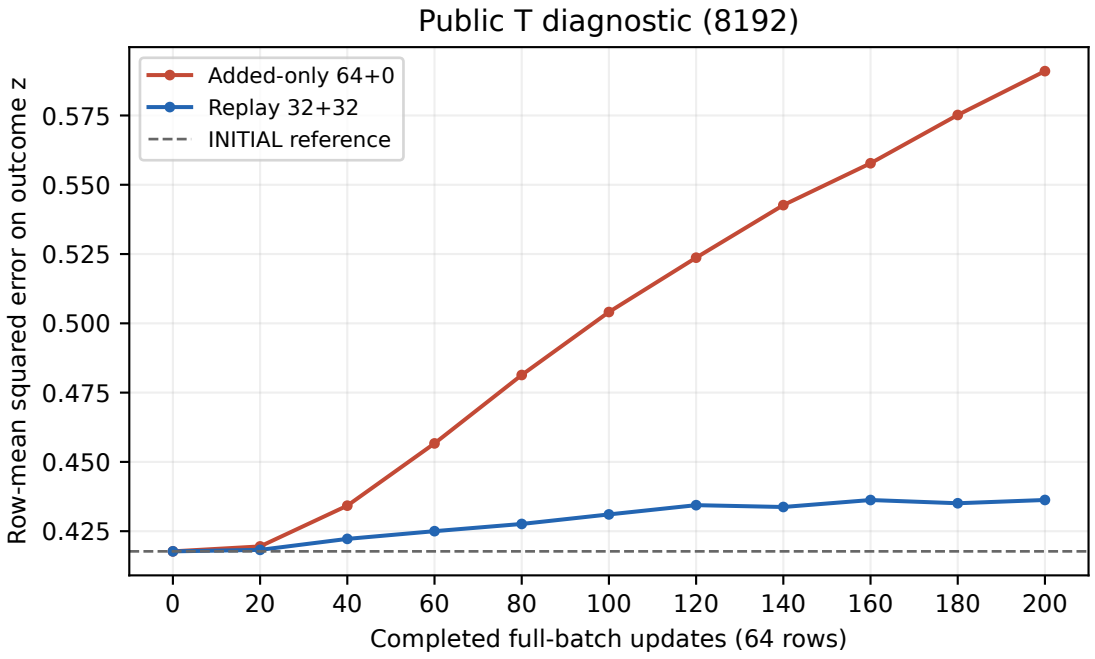
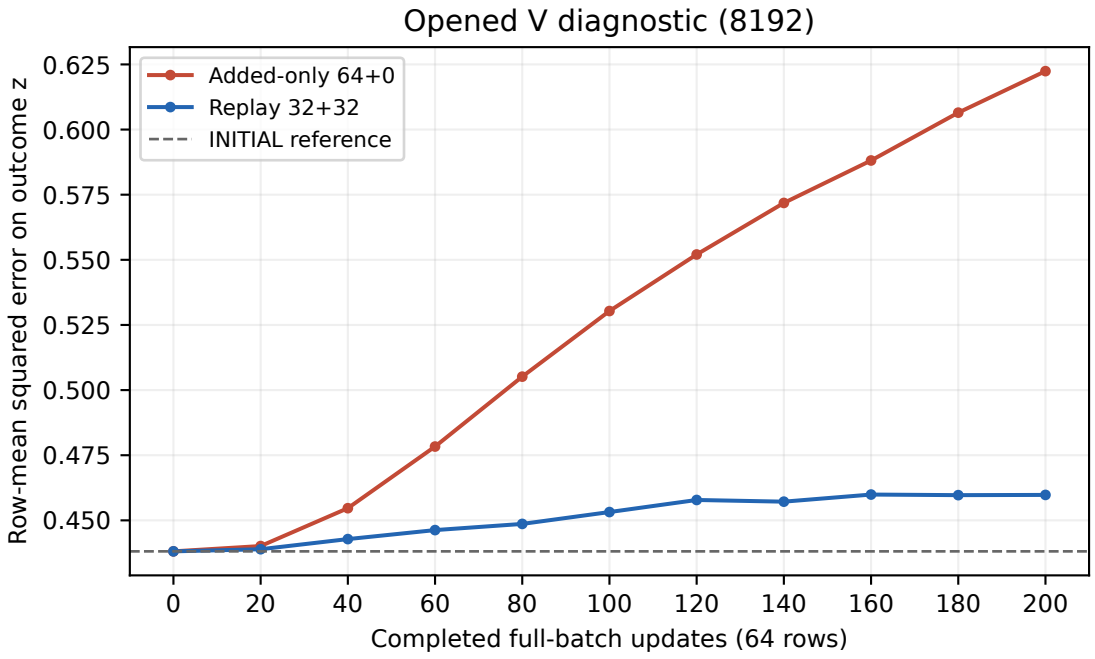
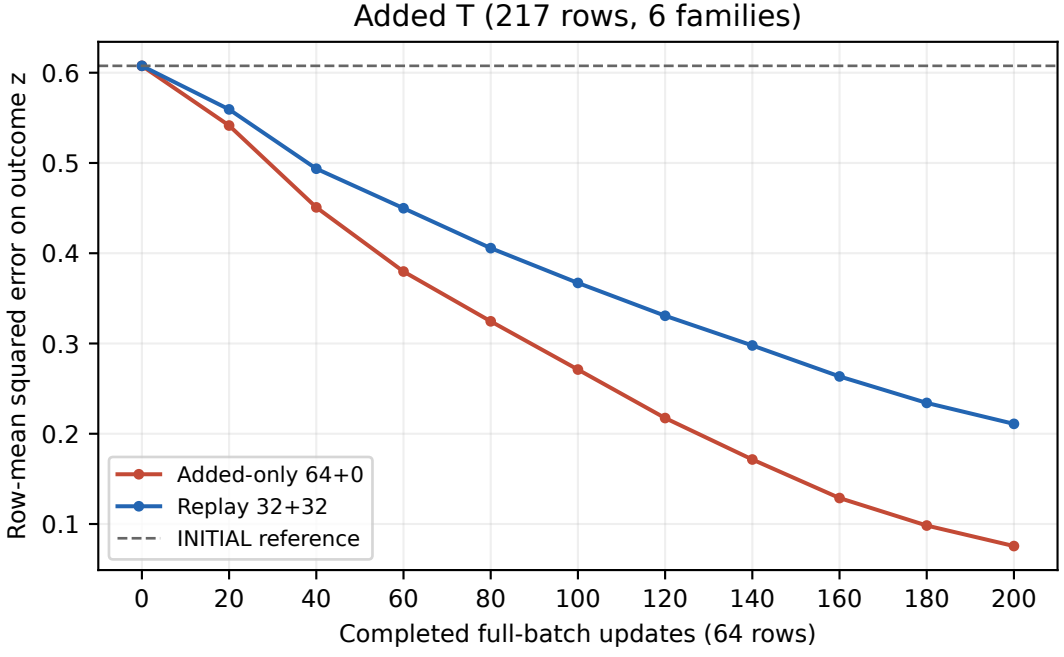
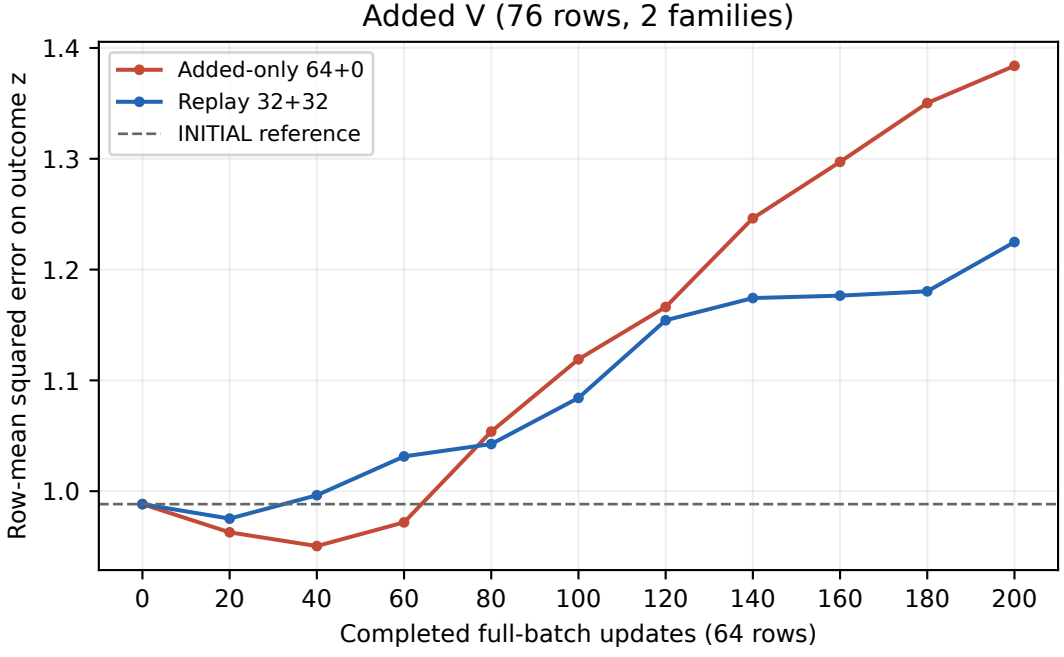
371: fixed LR0.001 / fresh BEST43 / outcome-z / preselected LAST200









11 evaluation points, not 11 weight snapshots. Same added prefix; replay halves added repetition. No strength or optimal-ratio claim.

INITIAL and LAST200: saved evaluation metrics

Scope	Checkpoint	Rows	MSE	Sign accuracy	|value| >= 0.9
Public T diagnostic (8192)	INITIAL	8192	0.417722	84.6436%	48.6450%

Exposure and finite-work census

Added-only: 12800 added / 0 public exposures; 217 distinct added, 12583 repeats.
Replay: 6400 added / 6400 public exposures; 217 distinct added, 6183 repeats; 6398 distinct public, 2 repeats.
Fresh independent Adam; LR0.001, updates1..20 linear warmup, then constant; 200 full64 batches each.
A forwards1034547 + B615397 + affected synthetic64 =1650008 <=2000000. Render adds0 forwards.
Full openedV INITIAL evaluated once in A; B reuses exactly that original bank. Each LAST evaluated once.
Row means; sign accuracy uses nonzero-label rows; saturation is measured |prediction| >=0.9.
Replay mitigated public MSE degradation versus added-only, but both worsened versus INITIAL.
Added V also worsened in both. Reduced added repetition is simultaneous, not an isolated replay effect.
Public labels lack complete game/history/termination/rules lineage. Opened V, two related added V families,
shared seeds/initializer limit generalization. No games, sealed E, convergence, optimum or strength claim.
